

FITBUDDY

AI Fitness Plan Generator Using Gemini Models

Mini Project Presentation

Name: _____

B.Sc Data Science – II Year

J. N. N. Art and Science

2. Introduction

- FitBuddy is an AI-based fitness planning mobile application.
- It uses Gemini models to generate a simple personalized activity plan.
- The user enters basic details such as goal, experience, time and equipment.
- The app converts the information into a structured plan that is easy to follow.
- The project demonstrates a practical use of Generative AI.

3. Problem Statement

- Beginners may not know how to organize a basic workout routine.
- Generic fitness information may not match a user's schedule or experience.
- Finding and organizing information from many sources can take time.
- Users need a simple interface that gives structured information in one place.
- FitBuddy addresses this as an educational AI prototype.

4. Objectives

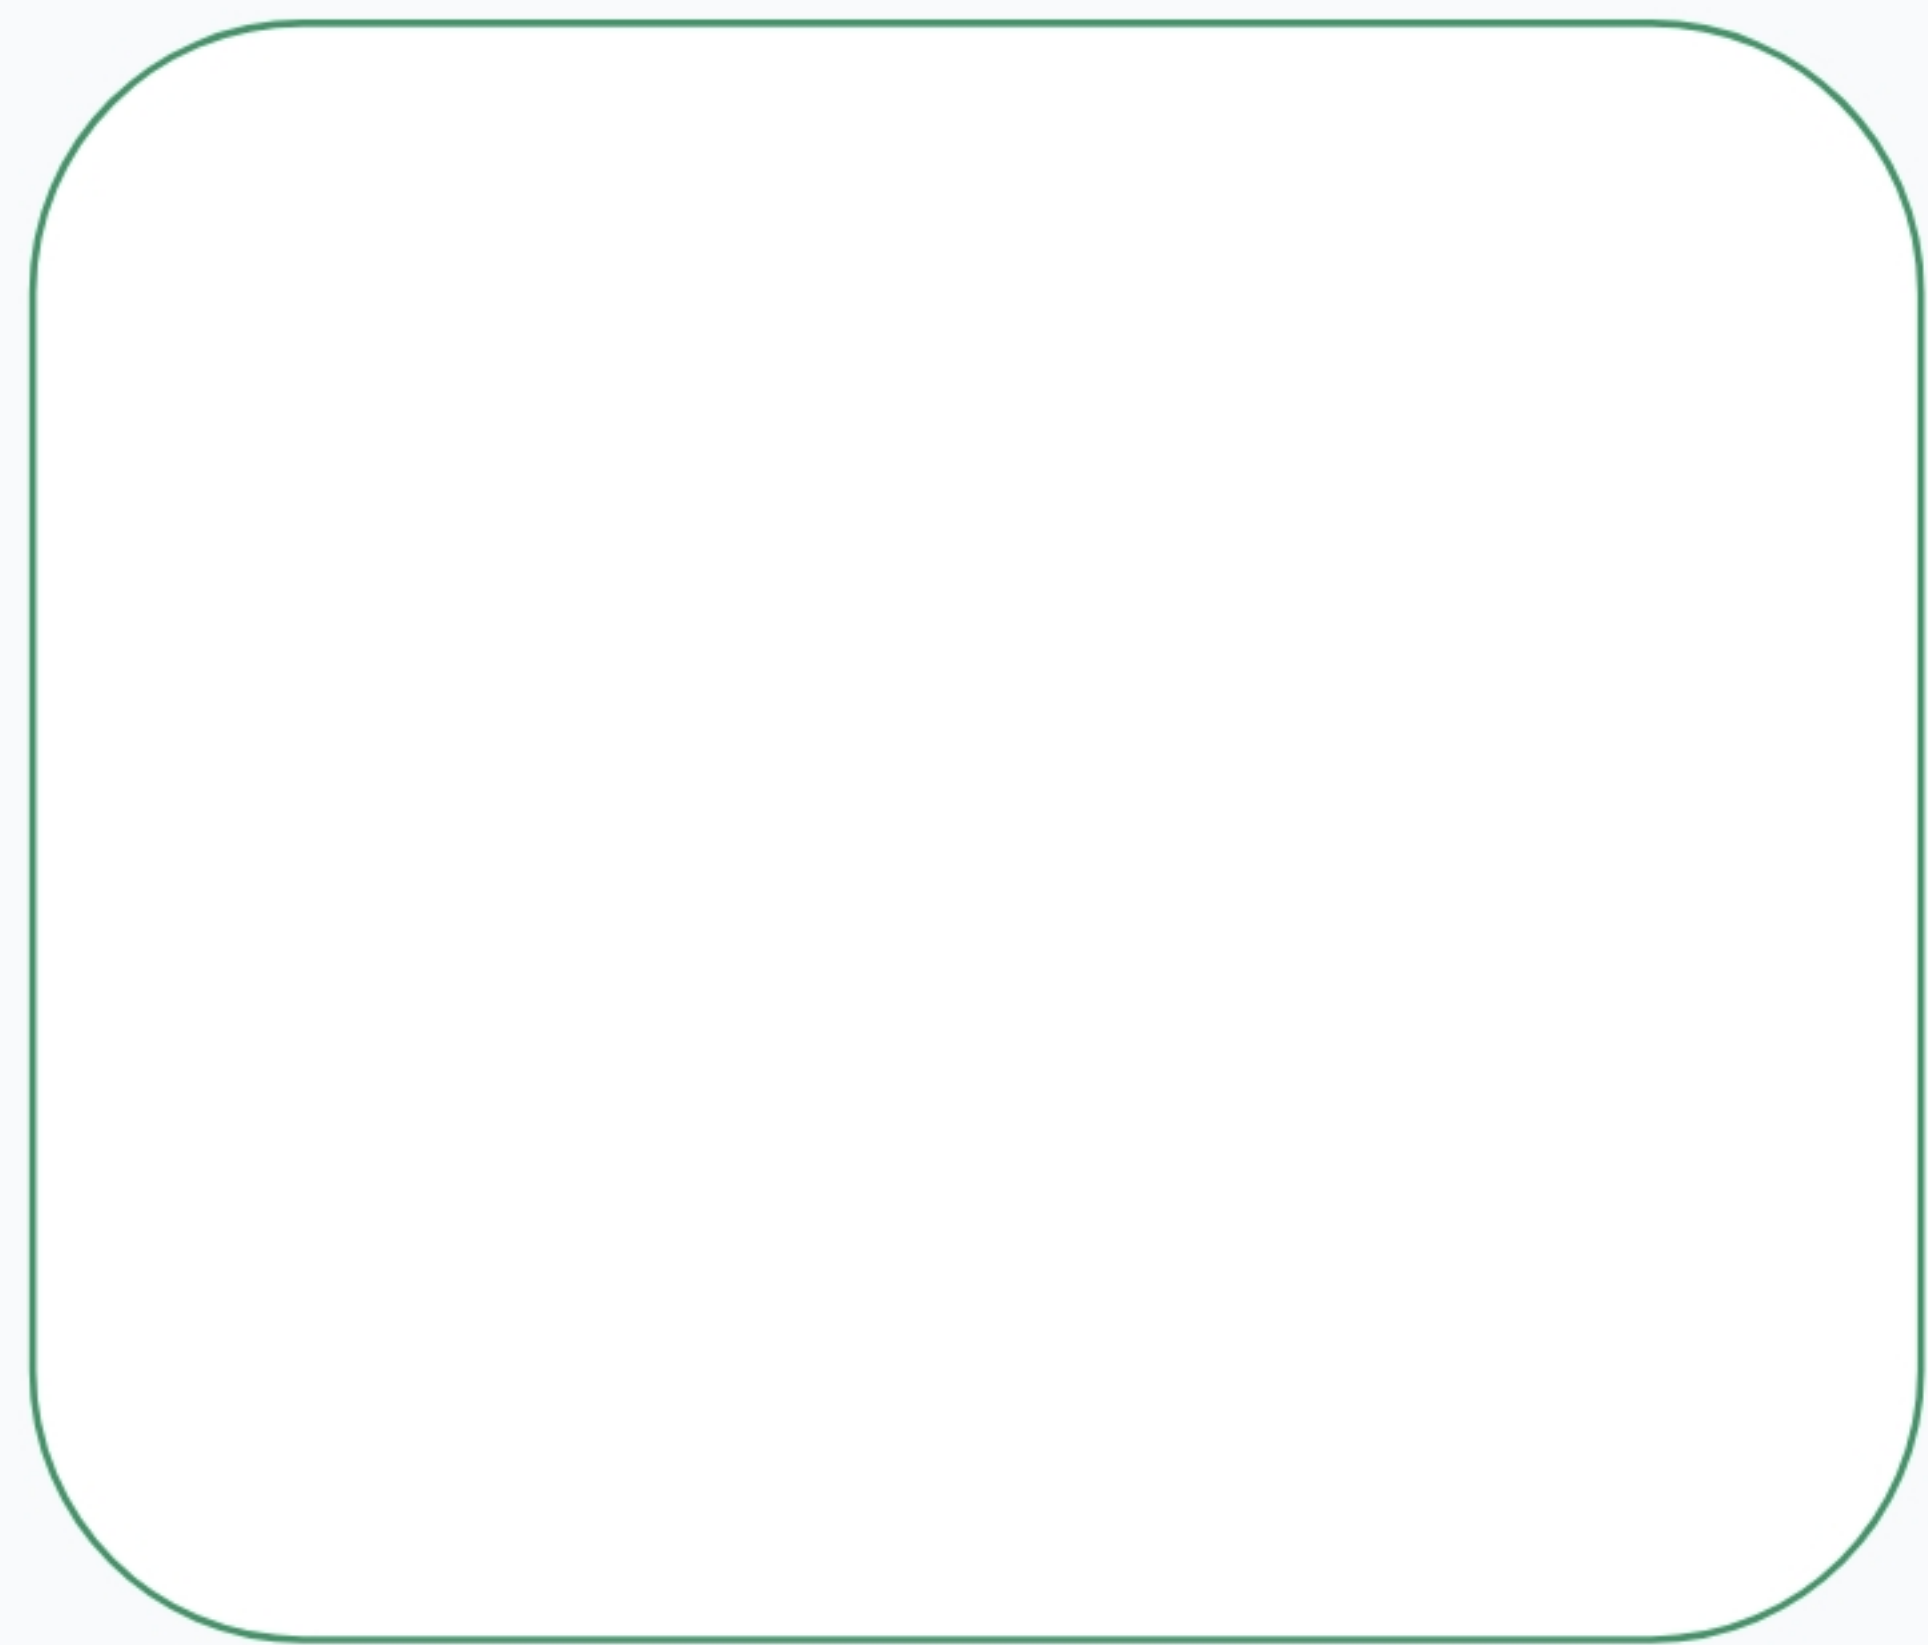

- Create a simple mobile-friendly fitness planning interface.
- Collect user preferences through an easy input form.
- Use Gemini to generate a structured weekly plan.
- Display the result clearly by day and activity.
- Store the generated plan for later viewing.
- Demonstrate prompt engineering and Generative AI integration.

5. Proposed System

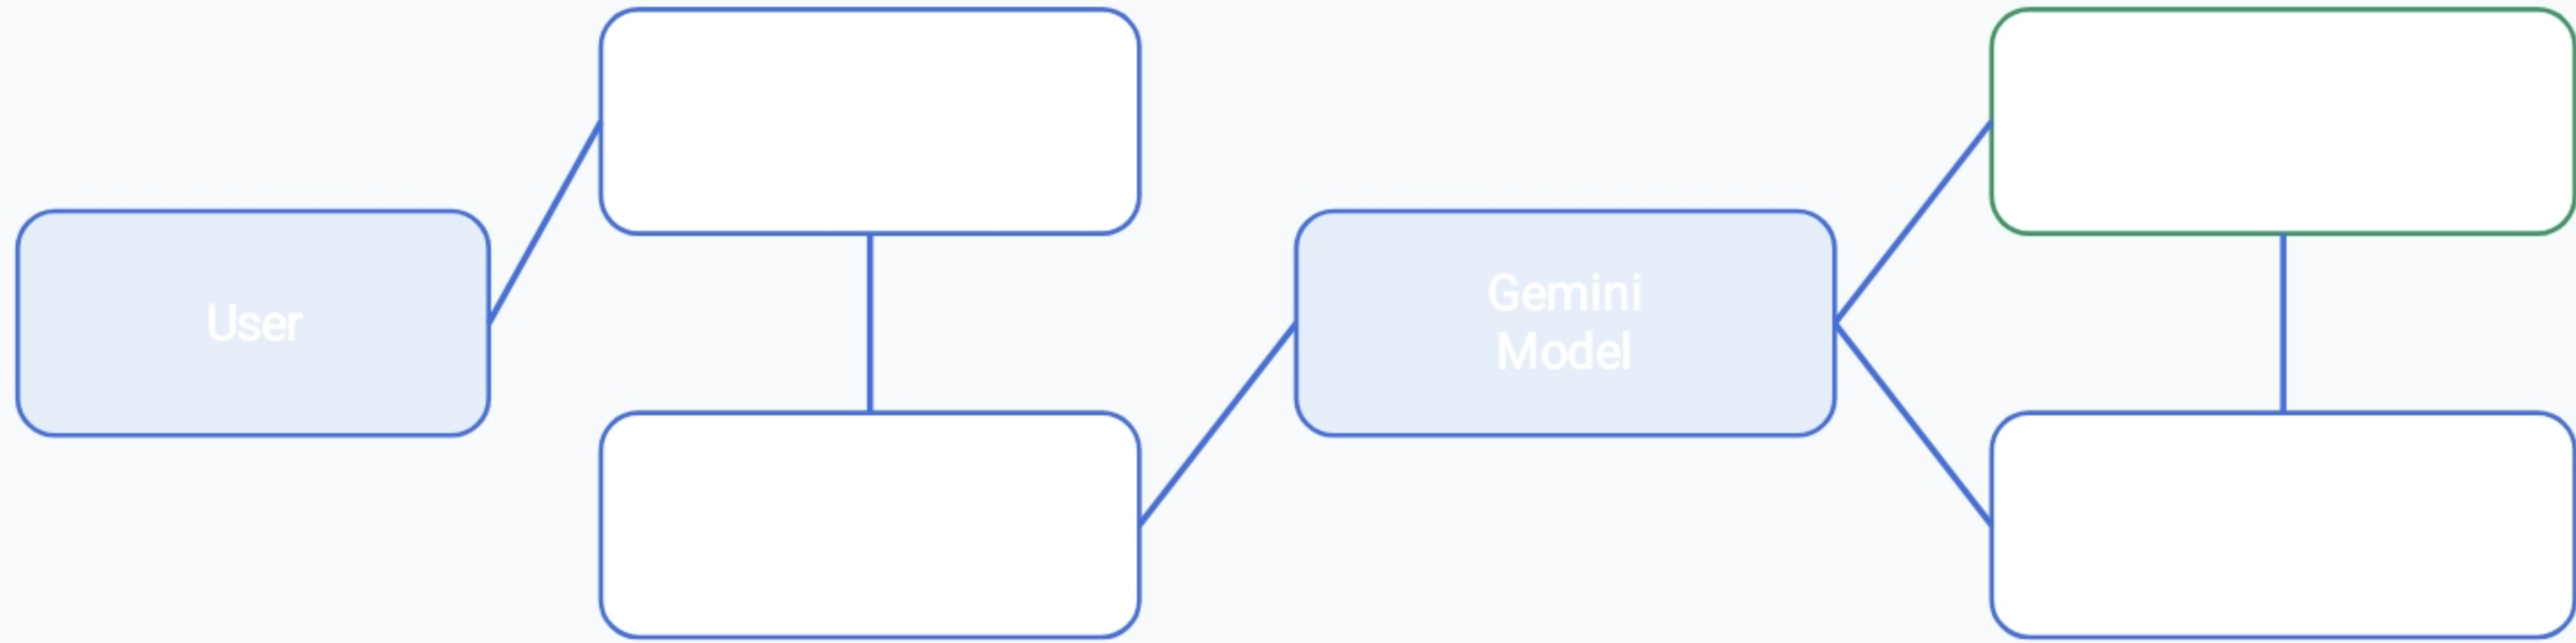

Solution: User details → App validates input → Gemini generates a structured plan → App displays and saves the result.

6. System Requirements

7. System Architecture – Block Diagram

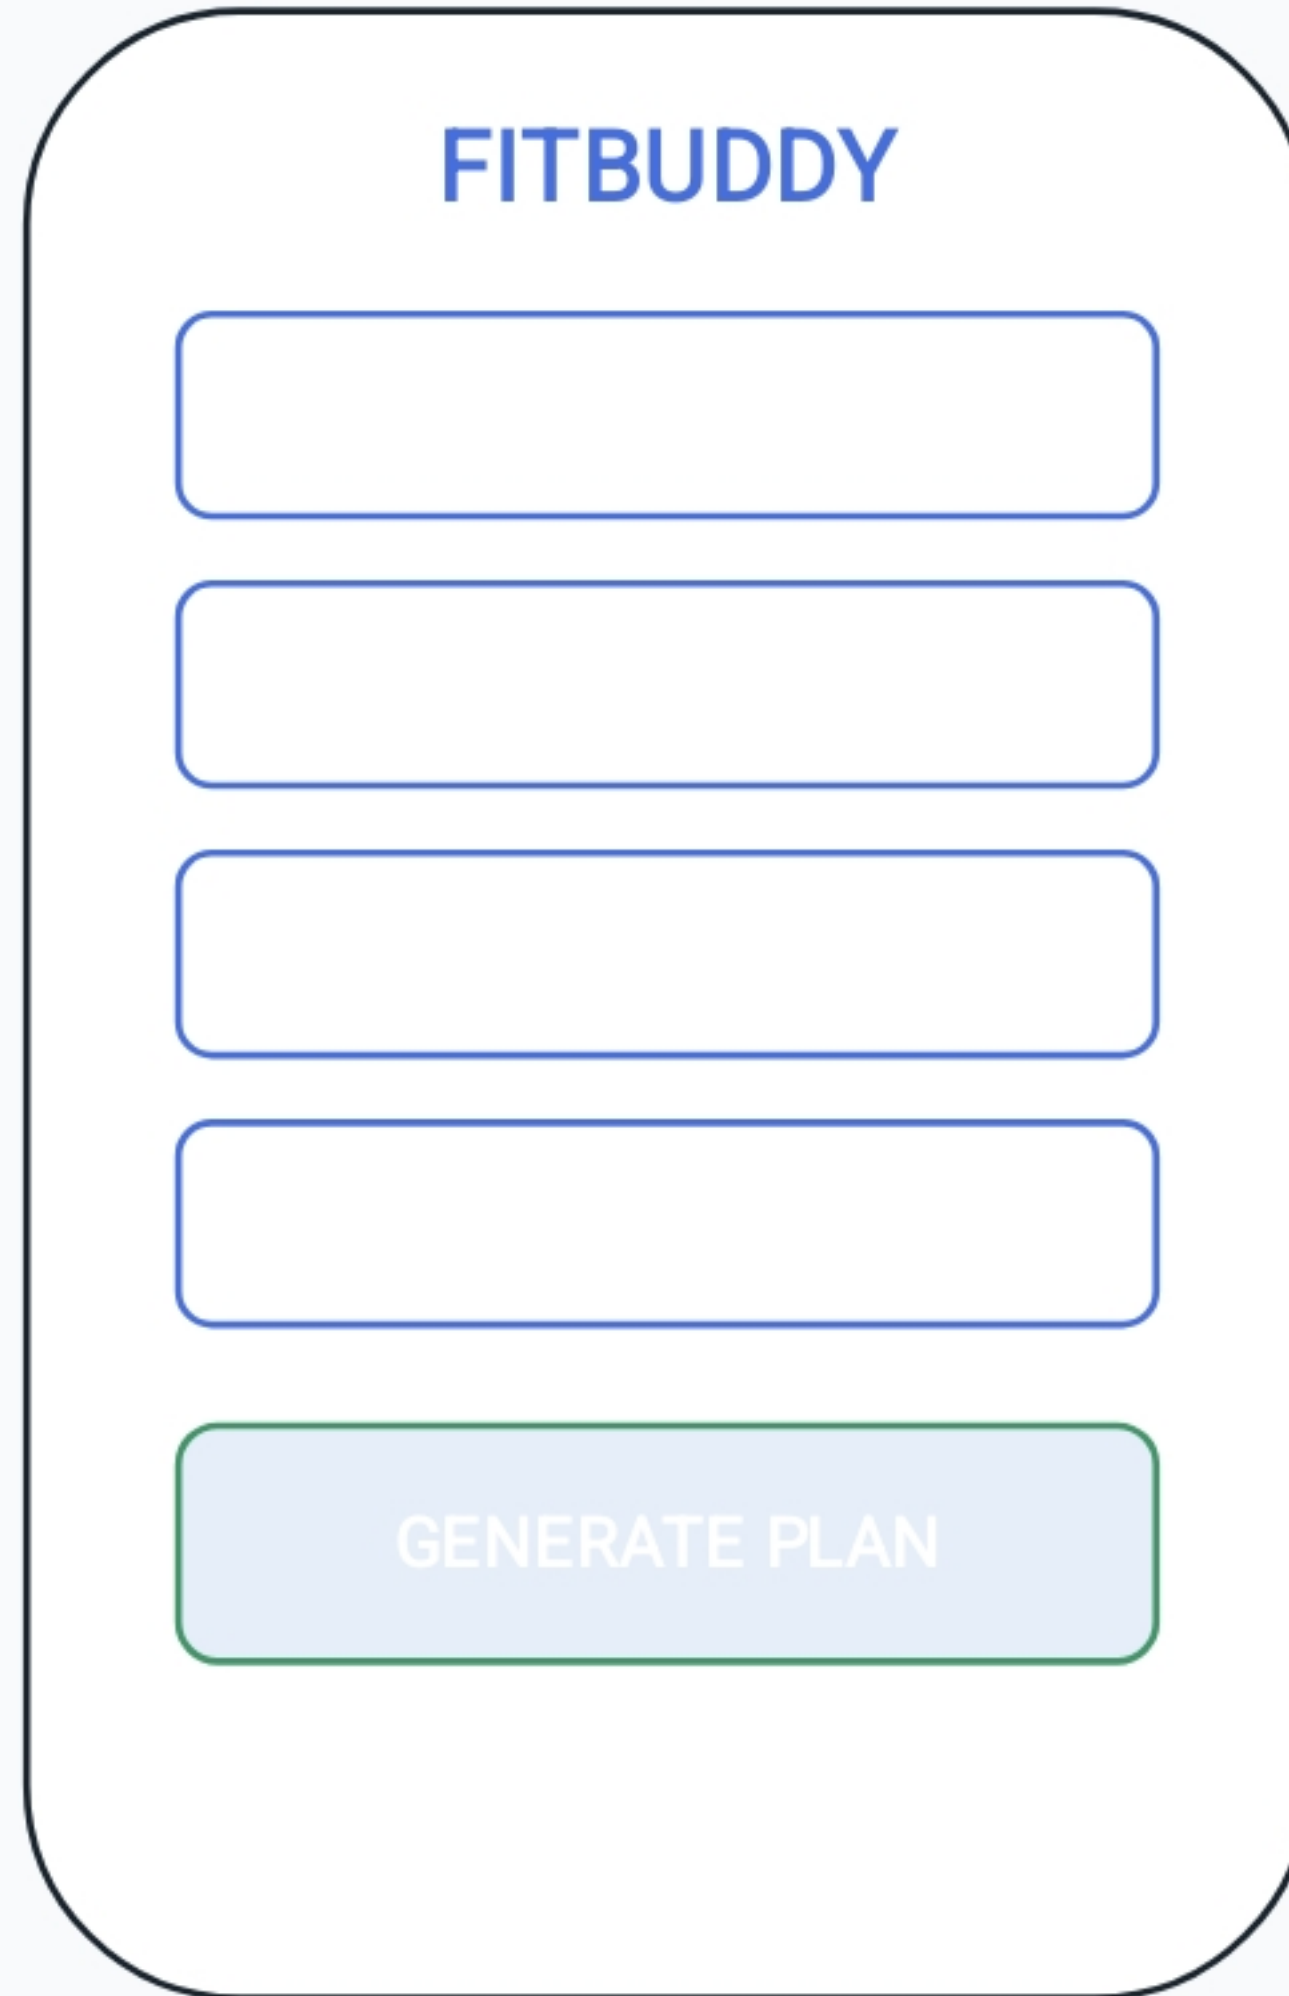

8. Modules

9. User Interface – Mobile App Design

Mobile app screens can include:

- Home
- User details
- Generate plan
- Weekly plan
- Saved plans

11. Data Flow Diagram

Flow: User enters details → App processes request → Gemini generates plan → Database stores result → App displays saved plan.

10. Database Design

User ID	Goal	Level	Time	Equipment	Generated Plan

The database stores user preferences and the generated plan so it can be viewed again.

12. Working Process

The process is automatic after the user submits the required details.

13. Advantages

- Simple and mobile-friendly design.
- Personalized output based on user inputs.
- Uses Generative AI for dynamic content.
- Saves time in preparing a basic plan.
- Generated plans can be stored and viewed later.
- Can be extended into a complete mobile application.

14. Future Enhancement

- Android/iOS full mobile application.
- Progress tracking with charts.
- Daily reminders and notifications.
- Voice input and Tamil language support.
- Wearable-device integration.
- Secure login and cloud database.
- Professional review / safety rules for stronger reliability.

15. Conclusion

FitBuddy shows how Generative AI can be integrated into a simple fitness-planning application. The project combines a mobile interface, database, prompt processing and Gemini AI to generate structured information for the user.
